Most of us have probably lost data from a flash drive or memory card without even noticing it. This is because flash drives and memory cards are the most convenient way to store data and take it with us and transfer it from computer to computer, or from tablet to tablet. However, as it happens with everything that we use, there comes a moment when the data is no longer usable and we wish we could extract it from the device. But what if it does not come back the way it was before? How can we retrieve the data? The task might seem impossible, but with a tool like BadCopy Pro, it is not. BadCopy is different from the majority of data recovery tools in that it actually uses a method that works like magic. This is because instead of analyzing the structure and nature of the data itself, BadCopy finds the data on the memory card or flash drive and then saves it back to the original place without us having to move the data, save it to another location, or re-format the drive. It is all done via this tool because it is way faster than anything else and can even recover data that was previously saved in FAT16, FAT32 or NTFS format. In short, BadCopy is a program that uses a "fishing" method that scans a memory card or flash drive, analyze the data and then the recovered data is stored back to the original device without moving the data, unrecording, changing, or anything like that. The data can be extracted from the memory card or flash drive that was being scanned regardless if the data was erased or corrupted. BadCopy is available for Windows 32/64 bit, and it has been tested to work with some of the most popular memory card readers and USB flash drives. When installing this application, you will find it supports various flash devices such as SD Card, SDHC Card, SDXC Card, XD Card, CF Card, Zip, Memory Card and many more. BadCopy is a free software, and it is included with all the popular flash cards and drives.
